Coordinate reference systems

Shape of the Earth, coordinates, map projections and CRS in practice

Examples: NRW, Kamp-Lintfort

From the Earth to a map

- A coordinate is only meaningful together with its CRS.
- CRS = datum (ellipsoid + position) + coordinate system (+ projection, units, axes)

Shape of the Earth → **Coordinates** → **Map projections** → **Germany / NRW** → **CRS in practice**

Wikipedia: Spatial reference system · Map projection

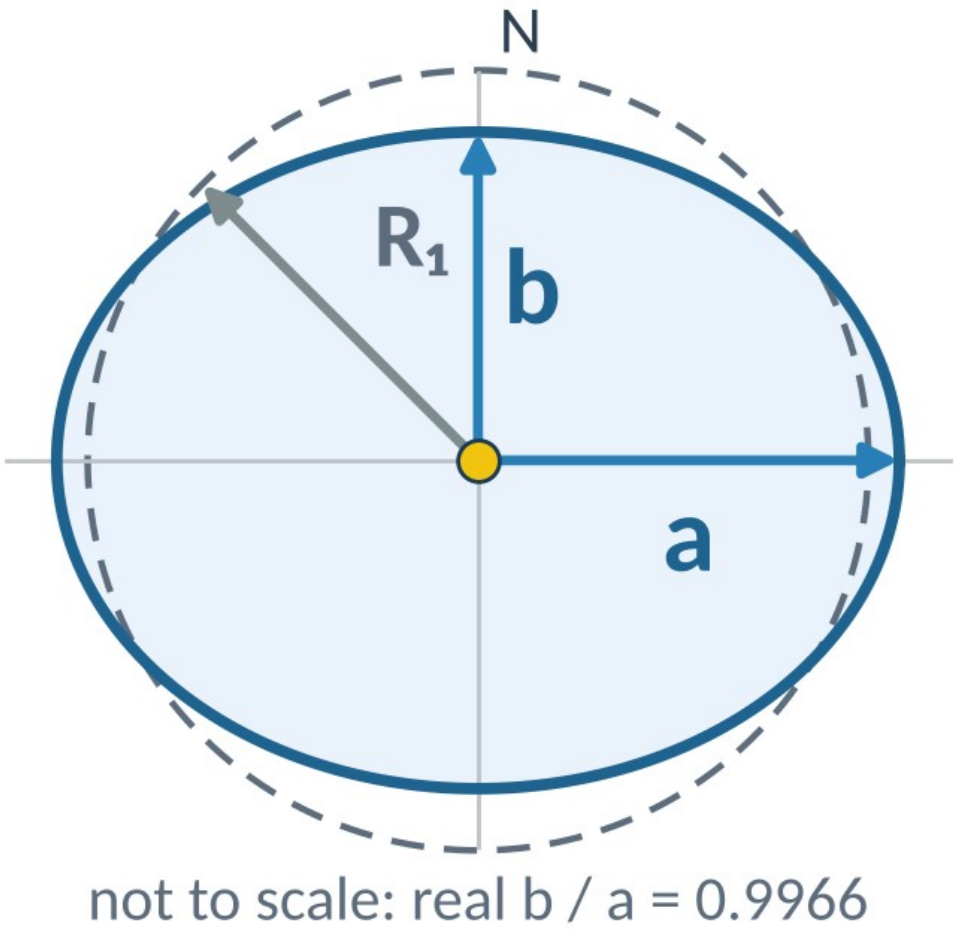

1 Shape of the Earth

ellipsoid · geoid · datum

Shape of the Earth | Coordinates | Map projections | Germany / NRW | CRS in practice

WGS 84: the ellipsoid with a, b and f

- Used by GPS, EPSG:4326
- Origin: Earth's centre of mass
- **a** = 6 378 137 m (equator)
- **b** = 6 356 752 m (pole)
- **f** = (a − b) / a = 1 / 298.257
- R_1 = (2a + b) / 3 = 6 371 km (mean radius)

Wikipedia: World Geodetic System · Flattening

Reference ellipsoids

Ellipsoid	a [m]	b [m]	1 / f	used by (datum · EPSG)
GRS80	6 378 137.000	6 356 752.314	298.257222101	ETRS89 · EPSG:4258
WGS84	6 378 137.000	6 356 752.314	298.257223563	WGS 84 · EPSG:4326 (GPS)
Bessel 1841	6 377 397.155	6 356 078.963	299.1528128	DHDN · EPSG:4314 (DE, old)
Clarke 1866	6 378 206.400	6 356 583.800	294.978698214	NAD27 · EPSG:4267 (US, old)

In QGIS

Project → Properties → General: ellipsoid for measurements

Layer Properties → Information: CRS and ellipsoid

a – b ≈ 21.4 km

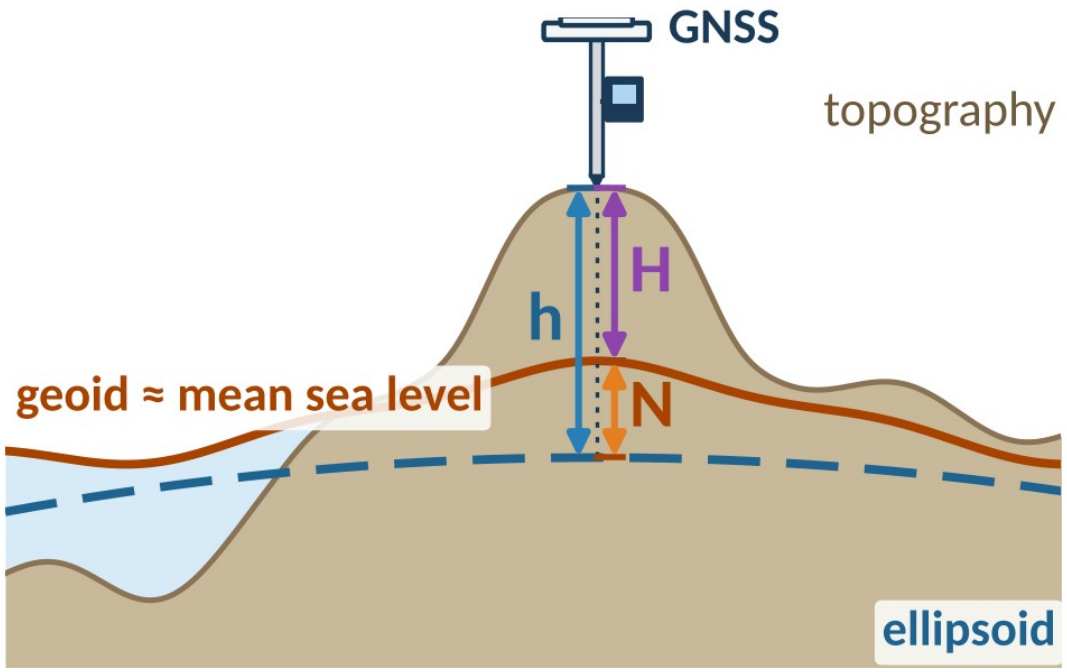

flattening f = (a – b) / a

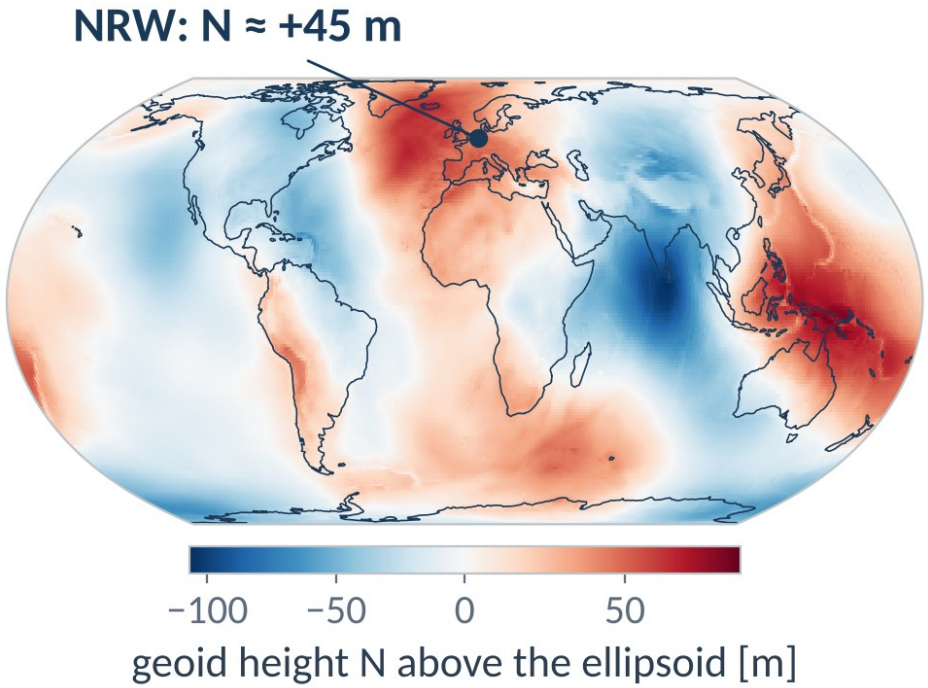

f ≈ 1 : 298, round to 0.3 %

Wikipedia: Earth ellipsoid · GRS 80 · World Geodetic System · Flattening

The geoid: where is 'zero height'?

$$h = H + N$$

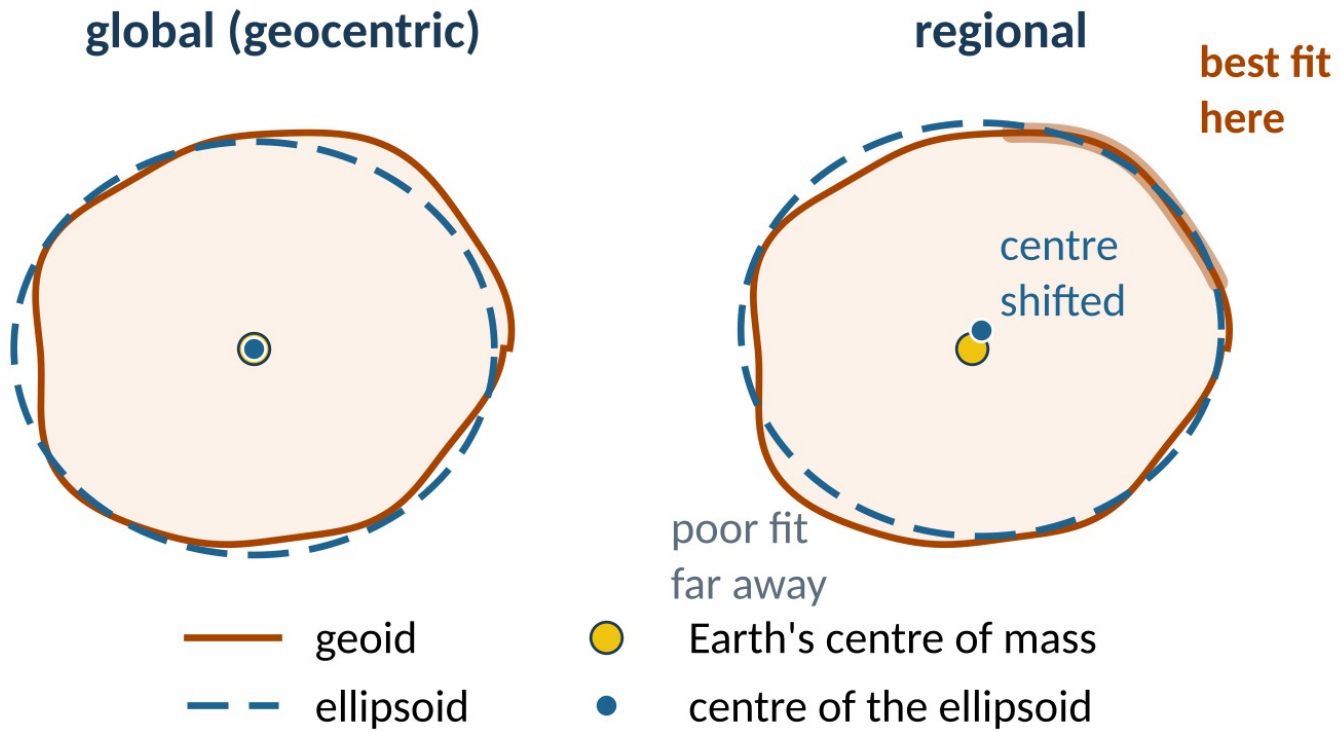

h GNSS **H** maps, DEM **N** geoid height

NRW: GNSS height ≈ map height + 45 m

Wikipedia: Geoid · Earth Gravitational Model · Orthometric height

Geoid: EGM96 (NGA/NASA, public domain) via PROJ-data. Coastlines and borders: Natural Earth (public domain). Cross-section schematic, vertical scale exaggerated.

Datum: where does the ellipsoid sit?

- **Global:** centre = centre of mass, used by GNSS
- **Regional:** fits one country closely (Bessel / DHDN), centre ≈ 0.7 km off

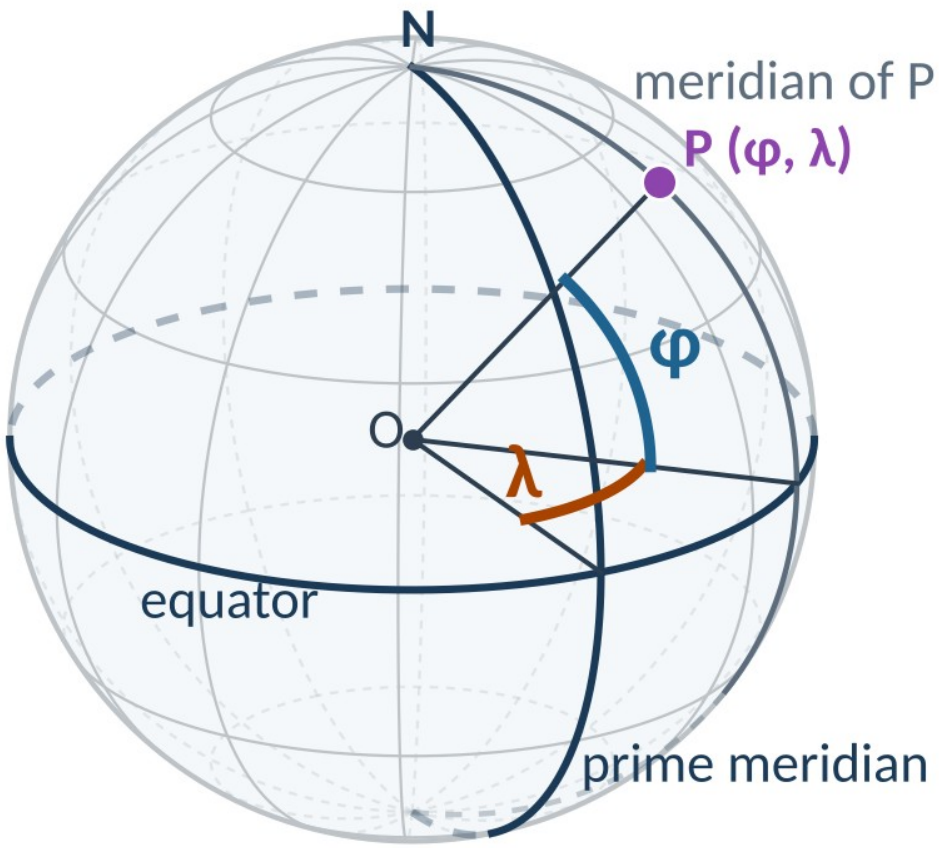

Wikipedia: Geodetic datum · Figure of the Earth

2 Coordinates

φ, λ, h · X, Y, Z

Geographic coordinates: latitude φ and longitude λ

- **λ longitude:** east + / west −, from the prime meridian, −180° … +180°
- **φ latitude:** north + / south −, from the equator, −90° … +90°
- **h** ellipsoidal height in m (part 1)
- **Kamp-Lintfort:** (φ, λ) = (51.5°, +6.53°) = (51.5° N, 6.53° E)

On the ellipsoid φ is the angle of the surface normal, not of the line to the centre (difference up to 0.19°).

Wikipedia: Geographic coordinate system · Latitude · Longitude · Prime meridian

Writing degrees

notation	latitude	longitude
degrees, minutes, seconds (DMS)	51° 30′ 00″ N	6° 32′ 00″ E
degrees, decimal minutes	51° 30.000′ N	6° 32.000′ E
decimal degrees	51.500000°	+6.533333°
Boston, signed (west < 0)	42.3601°	−71.0589°

In QGIS

Status bar: cursor coordinates

Right-click on map → Copy Coordinate

Wikipedia: Decimal degrees · NMEA 0183

How long is a degree?

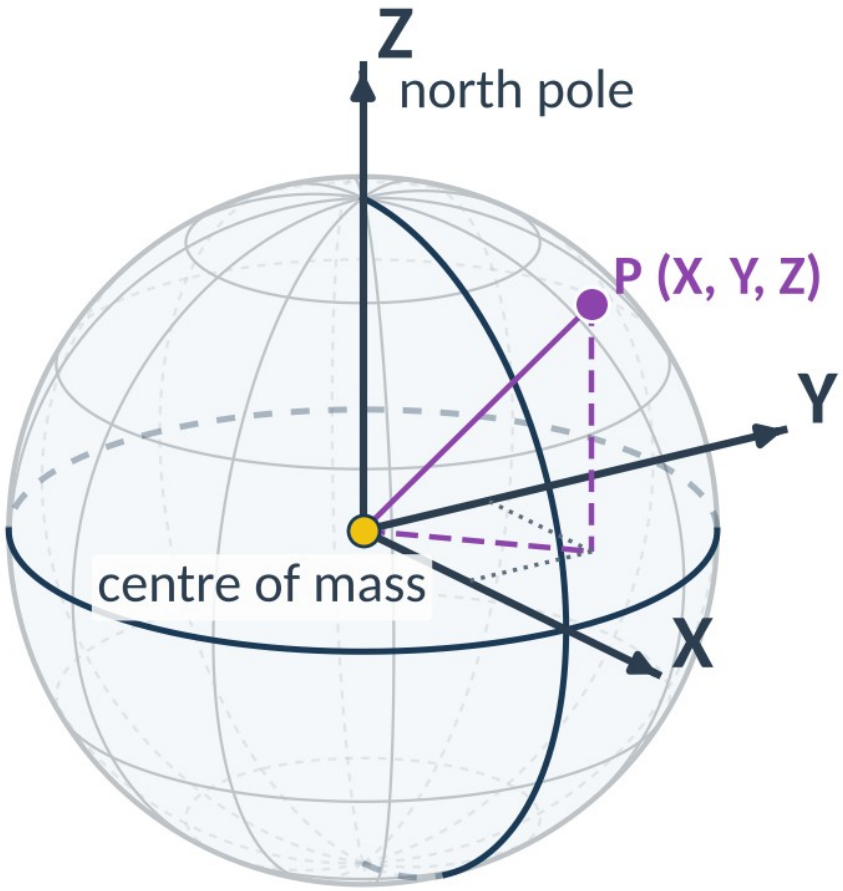

NRW (φ ≈ 51.5°)	north–south	east–west
1°	≈ 111 km	≈ 69 km
1′	≈ 1.85 km	≈ 1.16 km
1″	≈ 31 m	≈ 19 m
0.00001°	≈ 1.1 m	≈ 0.7 m

- 1′ north–south ≈ 1 nautical mile (1 852 m)
- NRW: 2.2° ≈ 245 km north–south

Wikipedia: Nautical mile · Geographic coordinate system

Geocentric coordinates X, Y, Z

- Origin: centre of mass, Z: rotation axis
- X: (φ, λ) = (0°, 0°) = (0° N, 0° E)
- Y: (φ, λ) = (0°, +90°) = (0° N, 90° E)
- Cartesian, metres, no projection

Kamp-Lintfort (ETRS89)	value
X	3 952 854 m
Y	452 700 m
Z	4 968 417 m

Where you meet X, Y, Z

GNSS processing, SAPOS station lists

datum transformations (part 4)

Wikipedia: Earth-centered, Earth-fixed coordinate system · Helmert transformation

Kamp-Lintfort in four notations

notation	value
DMS	51° 30′ 00″ N 6° 32′ 00″ E
decimal (φ, λ)	(51.500000°, +6.533333°)
(X, Y, Z) [m]	(3 952 854, 452 700, 4 968 417)
UTM 32N (E, N) [m]	(328 794, 5 708 314)

- Same place, different numbers: always state the CRS.
- Compare the UTM values of the two cities.

Pause: which city?

40° 42′ 46″ N
74° 00′ 22″ W

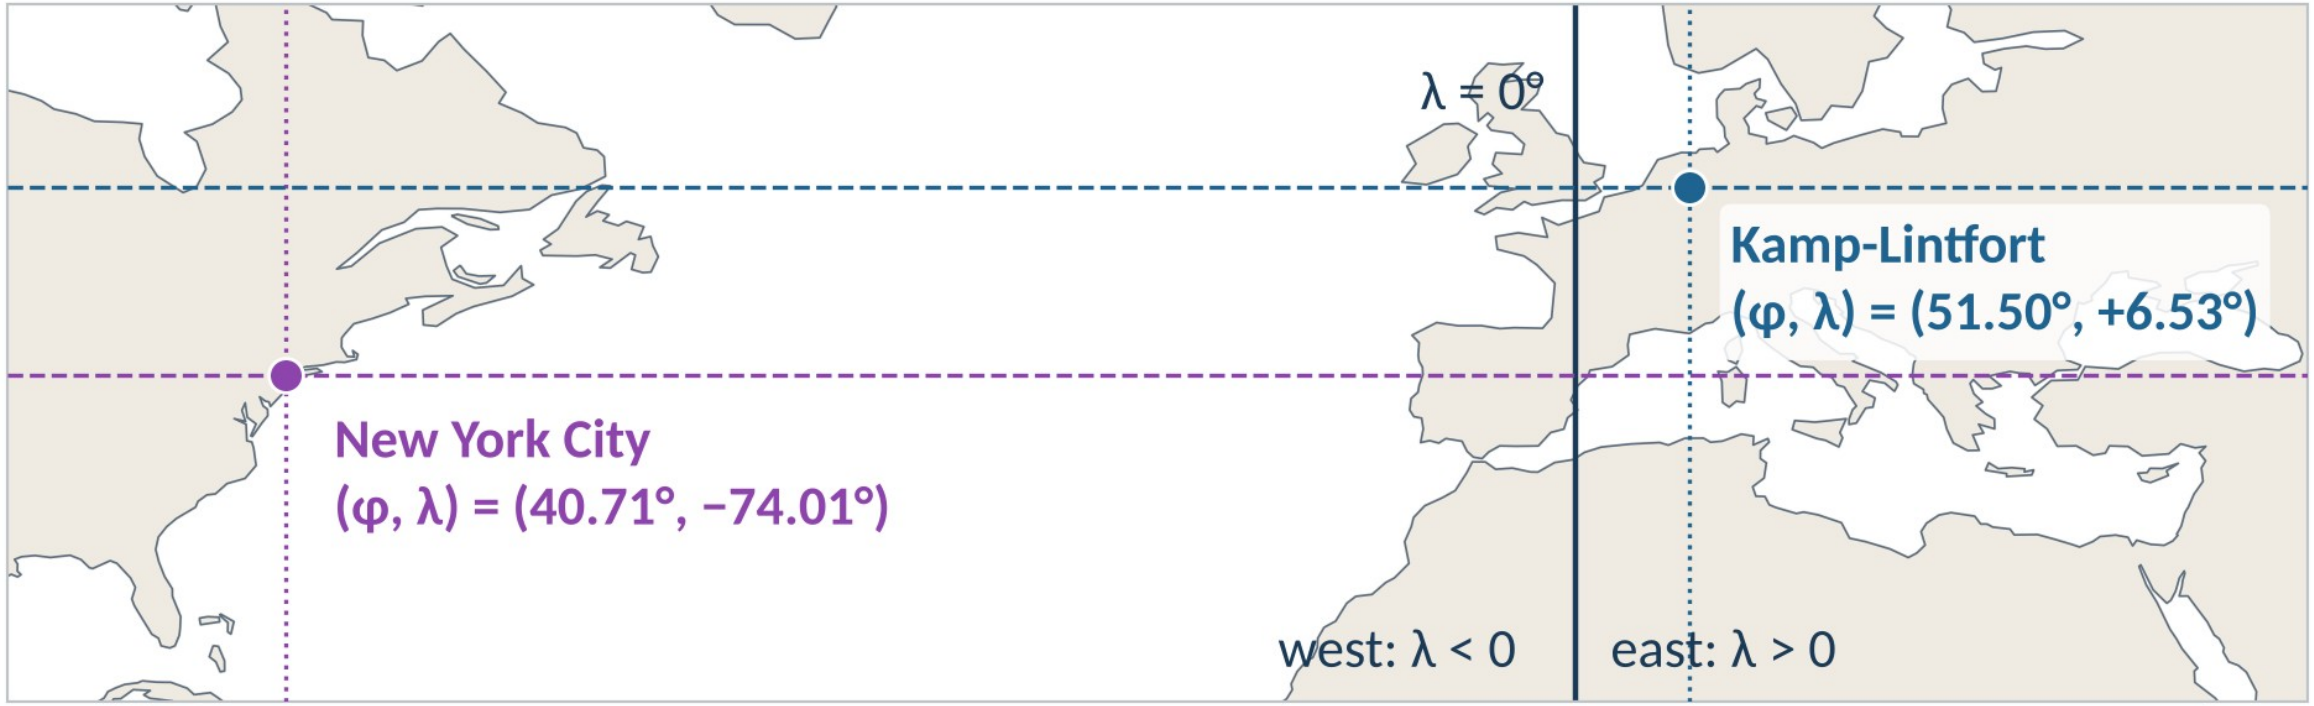

(40.7128°, −74.0060°)

UTM 18N (E, N):
(583 959, 4 507 351)

1 minute with your neighbour

Answer: New York City

11° further south than Kamp-Lintfort. West of Greenwich λ < 0: without the minus sign you land in Kyrgyzstan.

Coastlines and borders: Natural Earth (public domain)

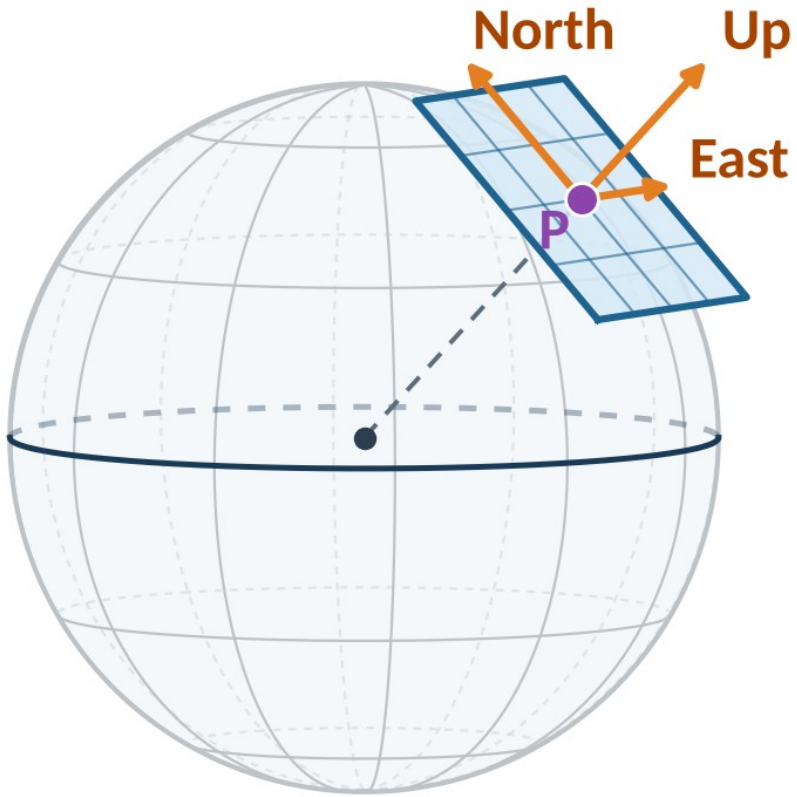

3 Map projections

surfaces · distortion · UTM

Shape of the Earth | Coordinates | **Map projections** | Germany / NRW | CRS in practice

Locally flat: the tangent plane

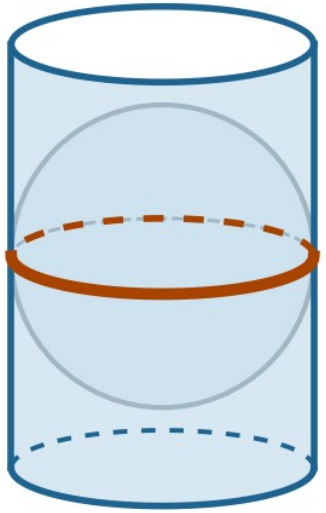

- Near P the Earth is almost flat: the tangent plane is a local map
- Local coordinates East, North, Up in metres
- Lengths fine to ≈ 10 km,
  heights not: curvature

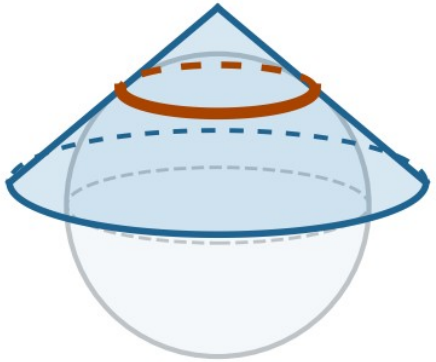

distance from P	plane above sphere	length error
1 km	8 cm	< 1 mm
10 km	7.8 m	8 mm
100 km	785 m	8.2 m

Wikipedia: Local tangent plane coordinates

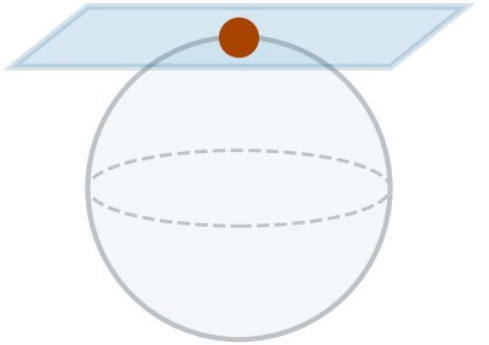

From the ellipsoid to the plane

cylindrical
touches along the equator

conical
touches along a parallel

azimuthal (plane)
touches at one point

- A projection is a formula (φ, λ) → (x, y); a sphere cannot be flattened without distortion.
- No distortion along the line of contact; the surface can be normal, transverse or oblique.

Wikipedia: Map projection · List of map projections

What can a projection preserve?

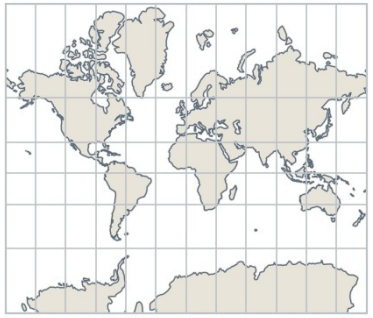

projection class	invariant: what is preserved	where it holds	examples (EPSG)
conformal (orthomorphic)	angles, shapes of small areas	everywhere	Mercator (3395), UTM (25832), stereographic
equal-area (equivalent, authalic)	areas	everywhere	LAEA (3035), Equal Earth (8857), Gall–Peters
equidistant	distances	from one or two points, or along certain lines	azimuthal equidistant, Plate Carrée
azimuthal (zenithal)	directions (azimuths)	only from the centre	stereographic, LAEA, gnomonic
gnomonic	great circles as straight lines	whole map (< hemisphere)	gnomonic

No projection is both conformal and equal-area. Azimuthal combines with the others.

Wikipedia: Map projection · Theorema Egregium

Six projections, six properties

Mercator
conformal: angles

Lambert az. equal-area
equal-area

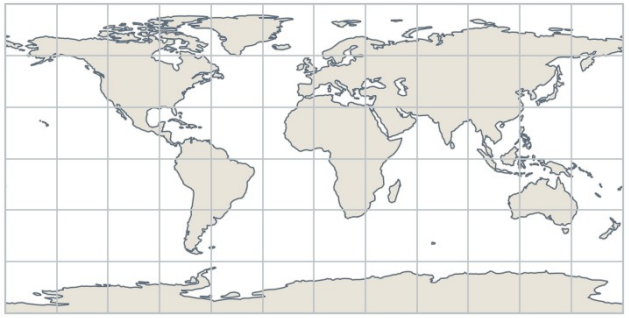

Plate Carrée
equidistant along meridians

Azimuthal equidistant
true distance from centre

Gnomonic
great circles = straight lines

Orthographic
view from space

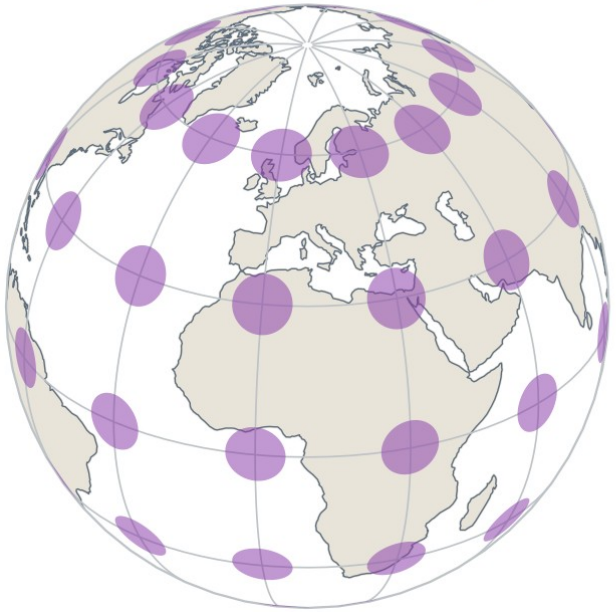

Each projection keeps one property: choose the projection by purpose.

Wikipedia: List of map projections · Gnomonic projection · Lambert azimuthal equal-area projection

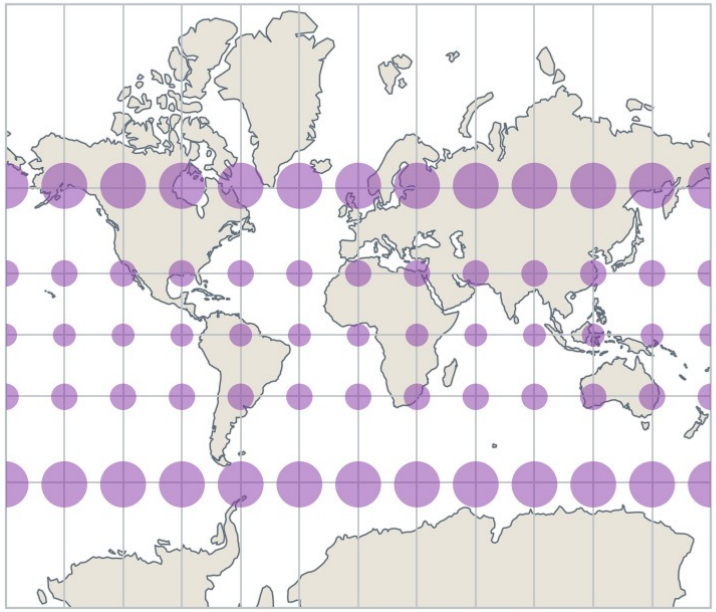

Coastlines and borders: Natural Earth (public domain)

Tissot's indicatrix: one circle, many places

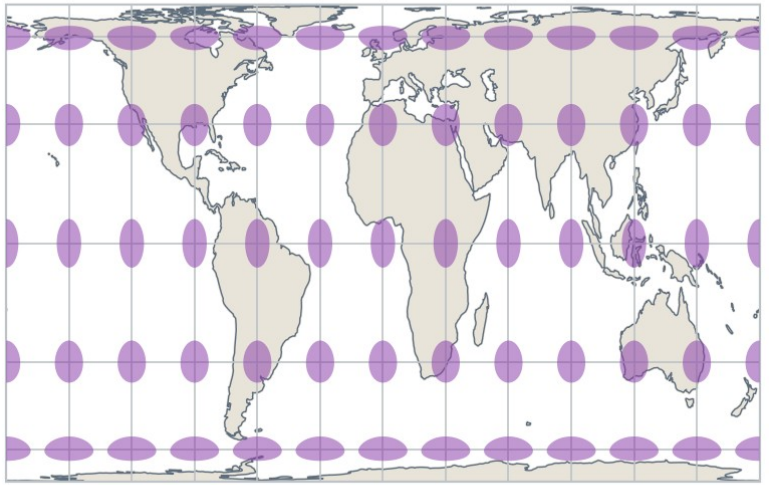

Globe (reference)

Mercator: conformal

Gall–Peters: equal-area

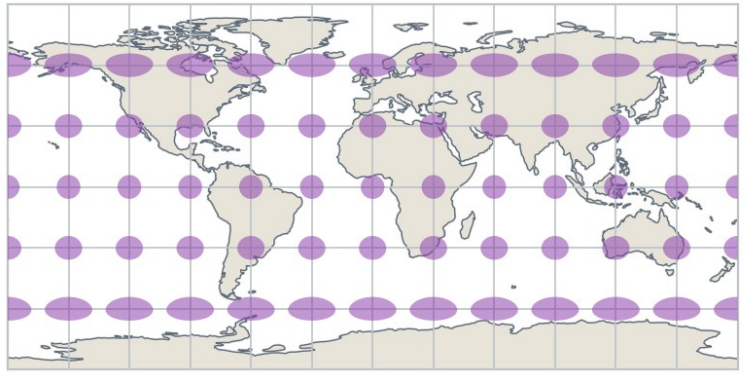

- On the globe all circles are equal (rim flattening is perspective).
- Same cylinder, opposite property: Mercator keeps shapes, Gall–Peters keeps areas.

Wikipedia: Tissot's indicatrix · Mercator projection · Gall–Peters projection

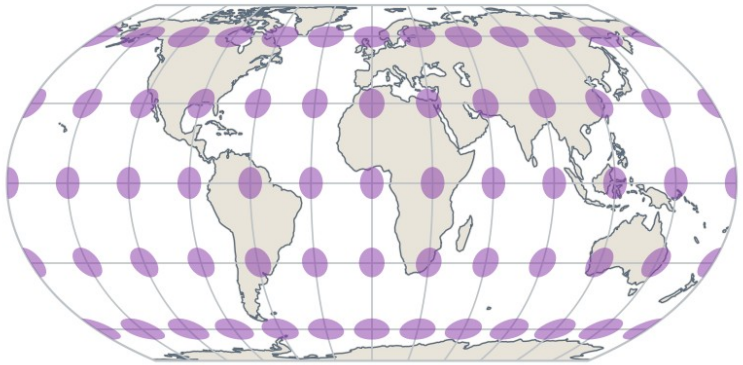

Coastlines and borders: Natural Earth (public domain)

Tissot's indicatrix: more projections

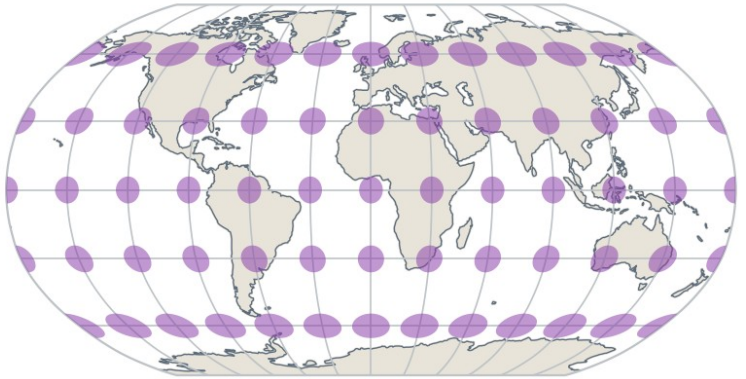

Plate Carrée

Equal Earth: equal-area

Robinson: compromise

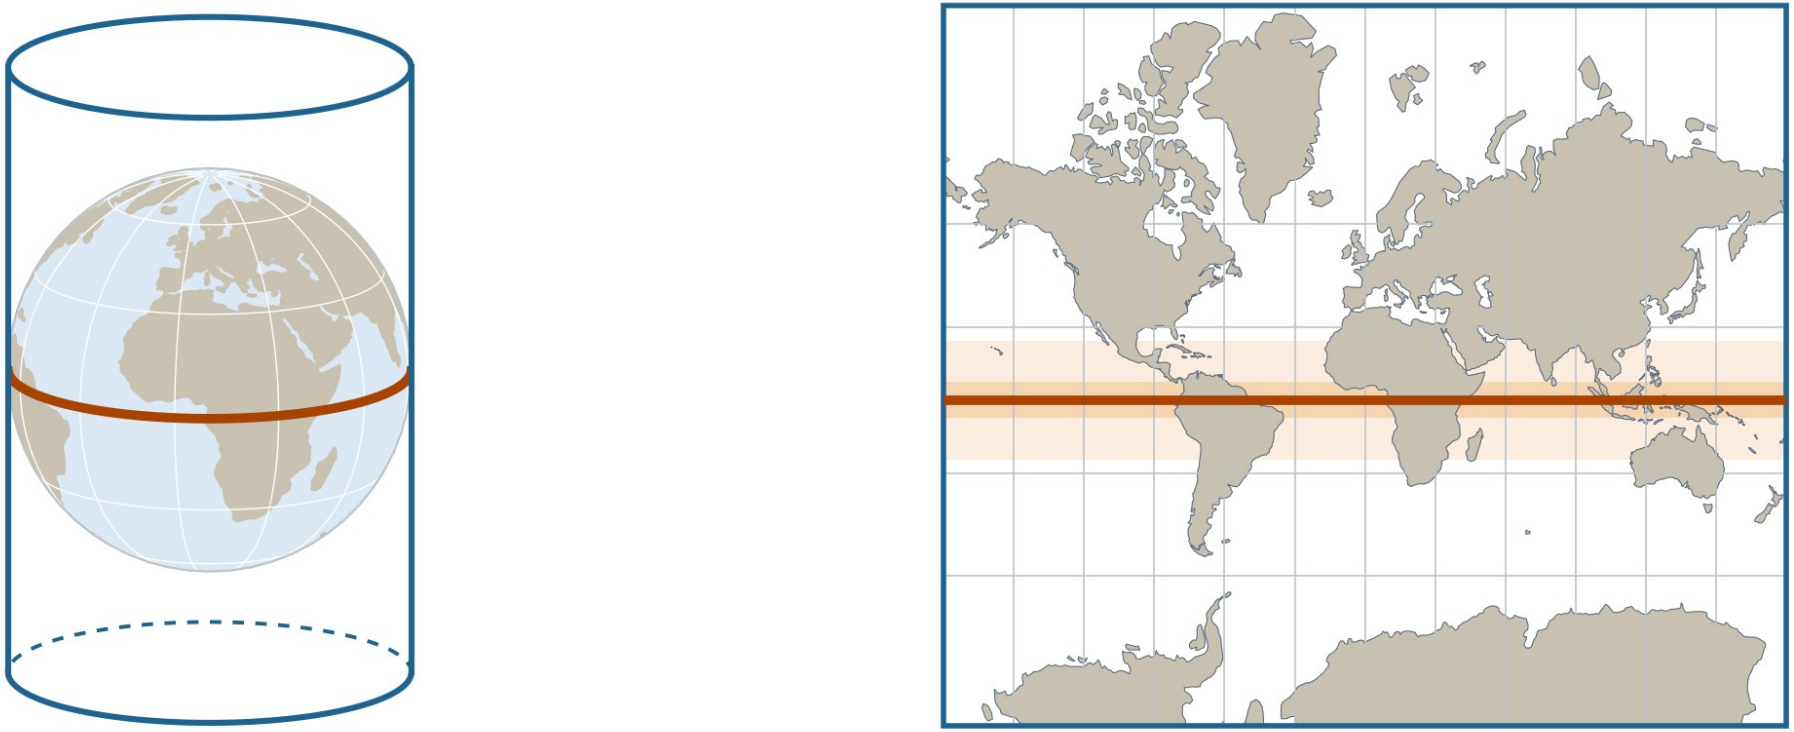

- Plate Carrée = (φ, λ) plotted directly: stretched east–west.
- Equal Earth: equal-area, natural shapes. Robinson: compromise.

Wikipedia: Tissot's indicatrix · Equal Earth projection · Robinson projection

Coastlines and borders: Natural Earth (public domain)

Mercator: the cylinder touches the equator

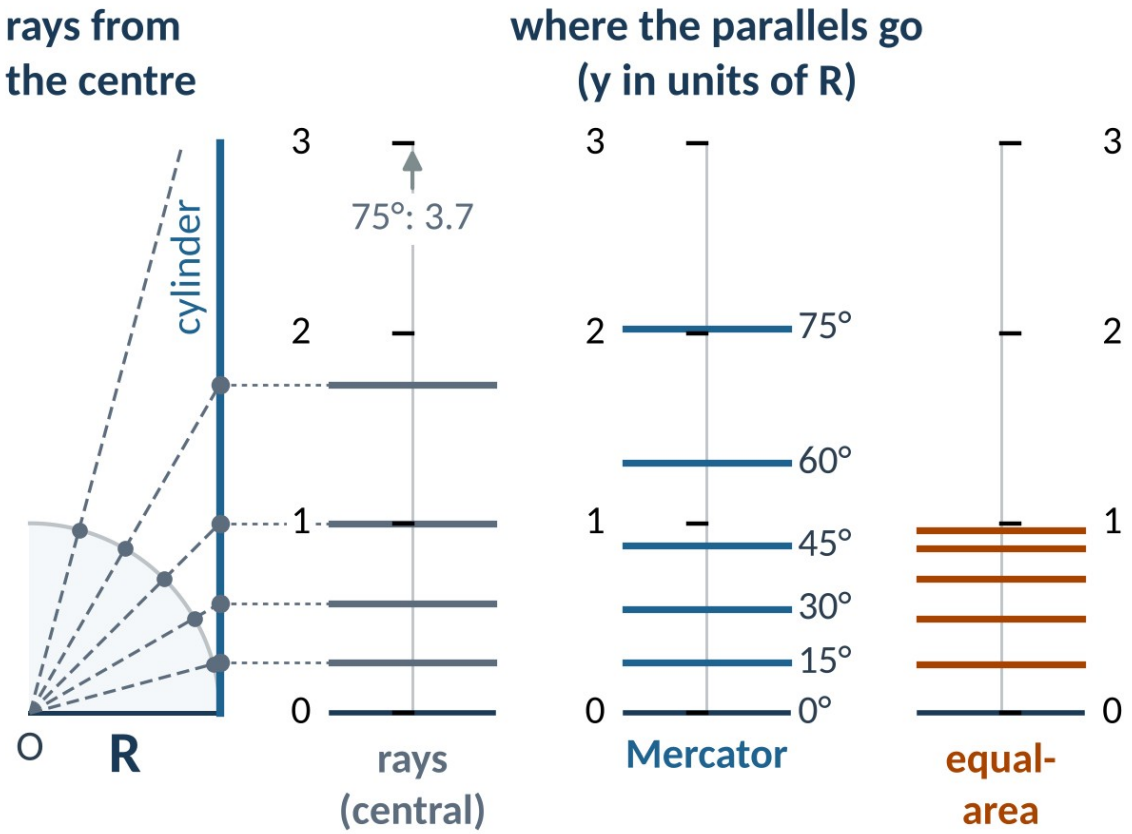

Exact along the equator, increasingly stretched towards the poles.

Wikipedia: Mercator projection

Coastlines and borders: Natural Earth (public domain)

How the Mercator map is built

- Rays from the centre give a different map
- Mercator: east–west stretch 1/cos φ
- Keep shapes ⇒ same stretch north–south: $\Delta y = R\,\Delta\varphi / \cos\varphi$

60°: ×2 in both directions

parallels spread out towards the poles

Wikipedia: Mercator projection · Central cylindrical projection

Mercator: true angles, wrong areas

million km²	Greenland	Africa
true area	2.2	29.9

- Africa is 14 × larger than Greenland
- On Mercator, Greenland looks even larger than Africa
- Scale grows with 1 / cos φ:
  ×2 at 60°

Wikipedia: Mercator projection · Web Mercator projection

Coastlines and borders: Natural Earth (public domain)

Rhumb line or great circle?

Mercator: rhumb line straight

Globe: the great circle goes all around the Earth

rhumb line (loxodrome): constant heading 259° 6 312 km

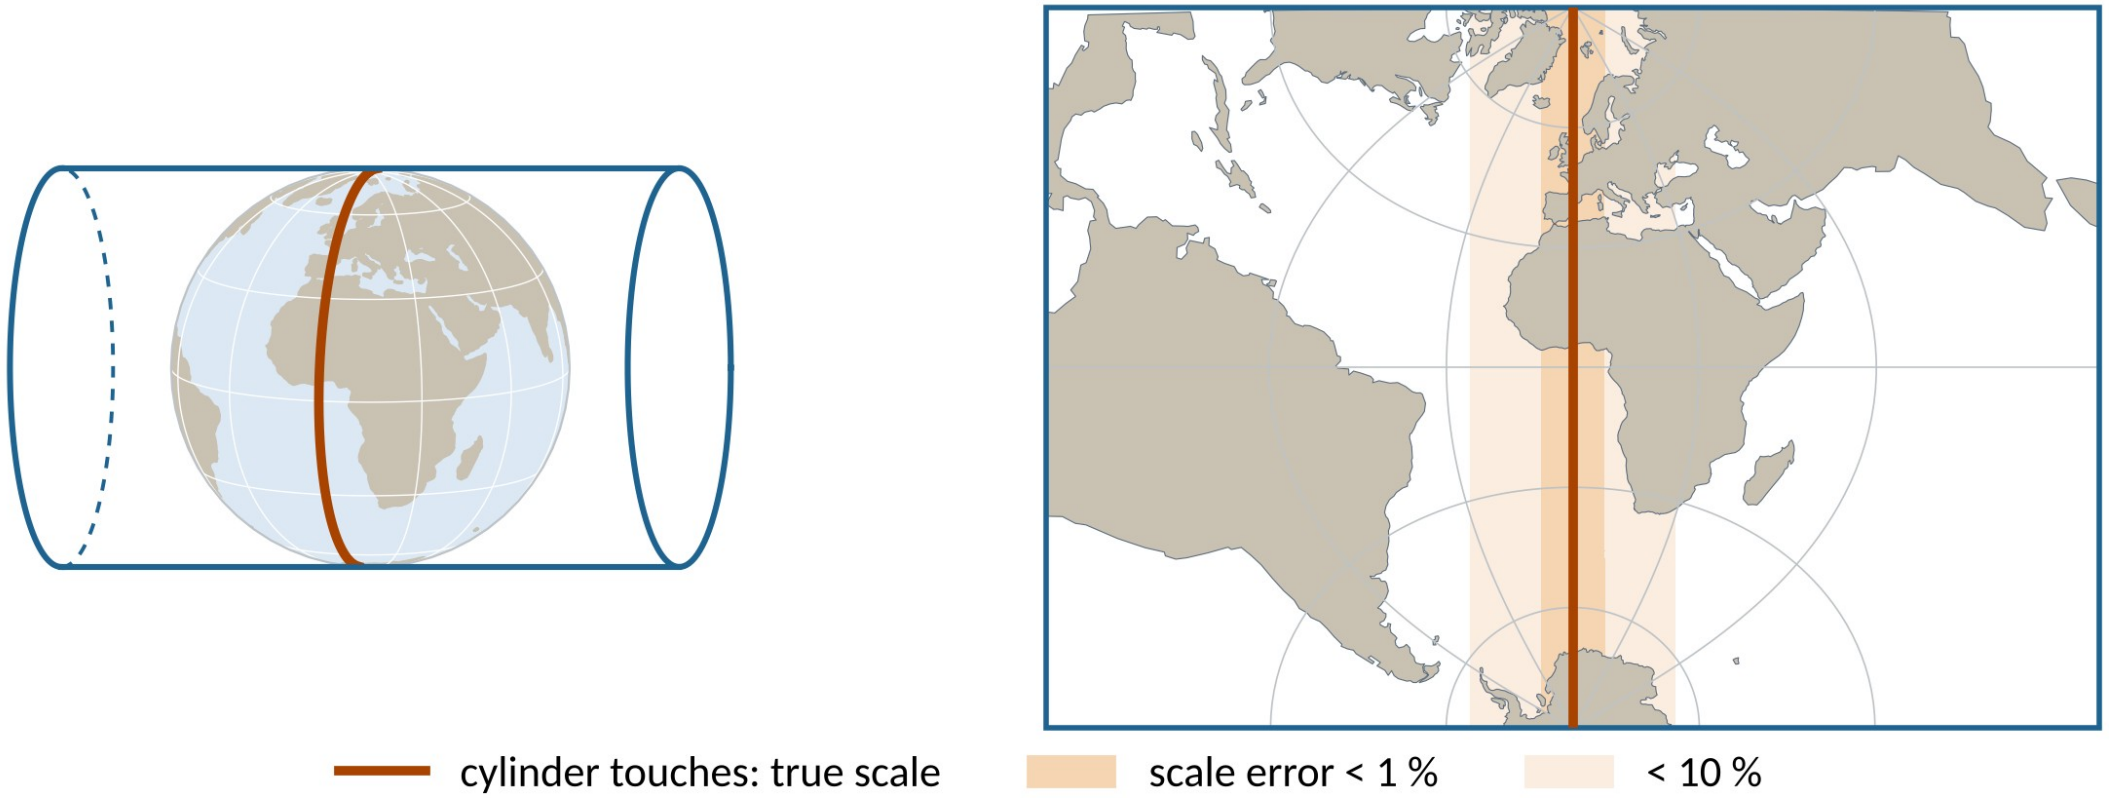

great circle (geodesic): shortest 6 019 km

Shortest is not straight on the map: the great circle saves 294 km.

Wikipedia: Rhumb line · Great circle · Great-circle navigation

Coastlines and borders: Natural Earth (public domain)

Transverse Mercator: the cylinder turned sideways

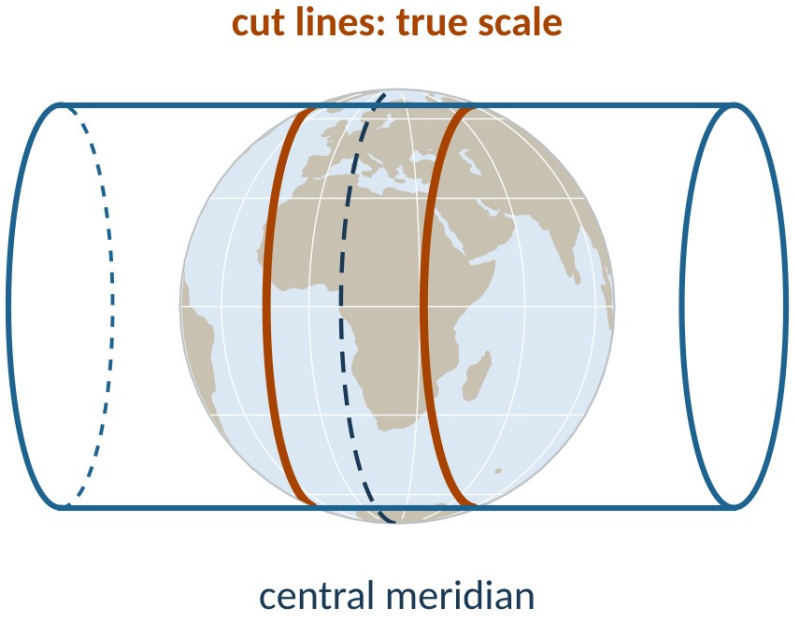

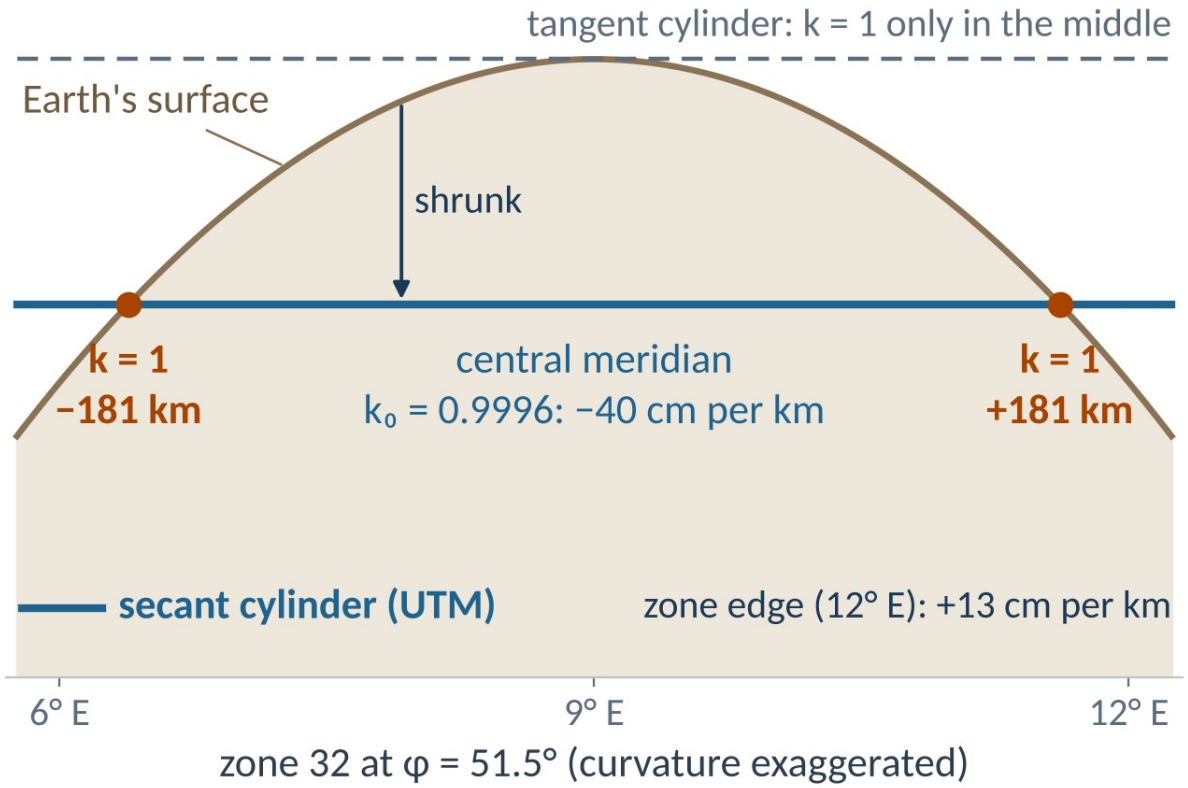

Exact along the central meridian: used in narrow strips (Gauss-Krüger 3°, UTM 6°).

Wikipedia: Transverse Mercator projection

Coastlines and borders: Natural Earth (public domain)

UTM: the secant cylinder

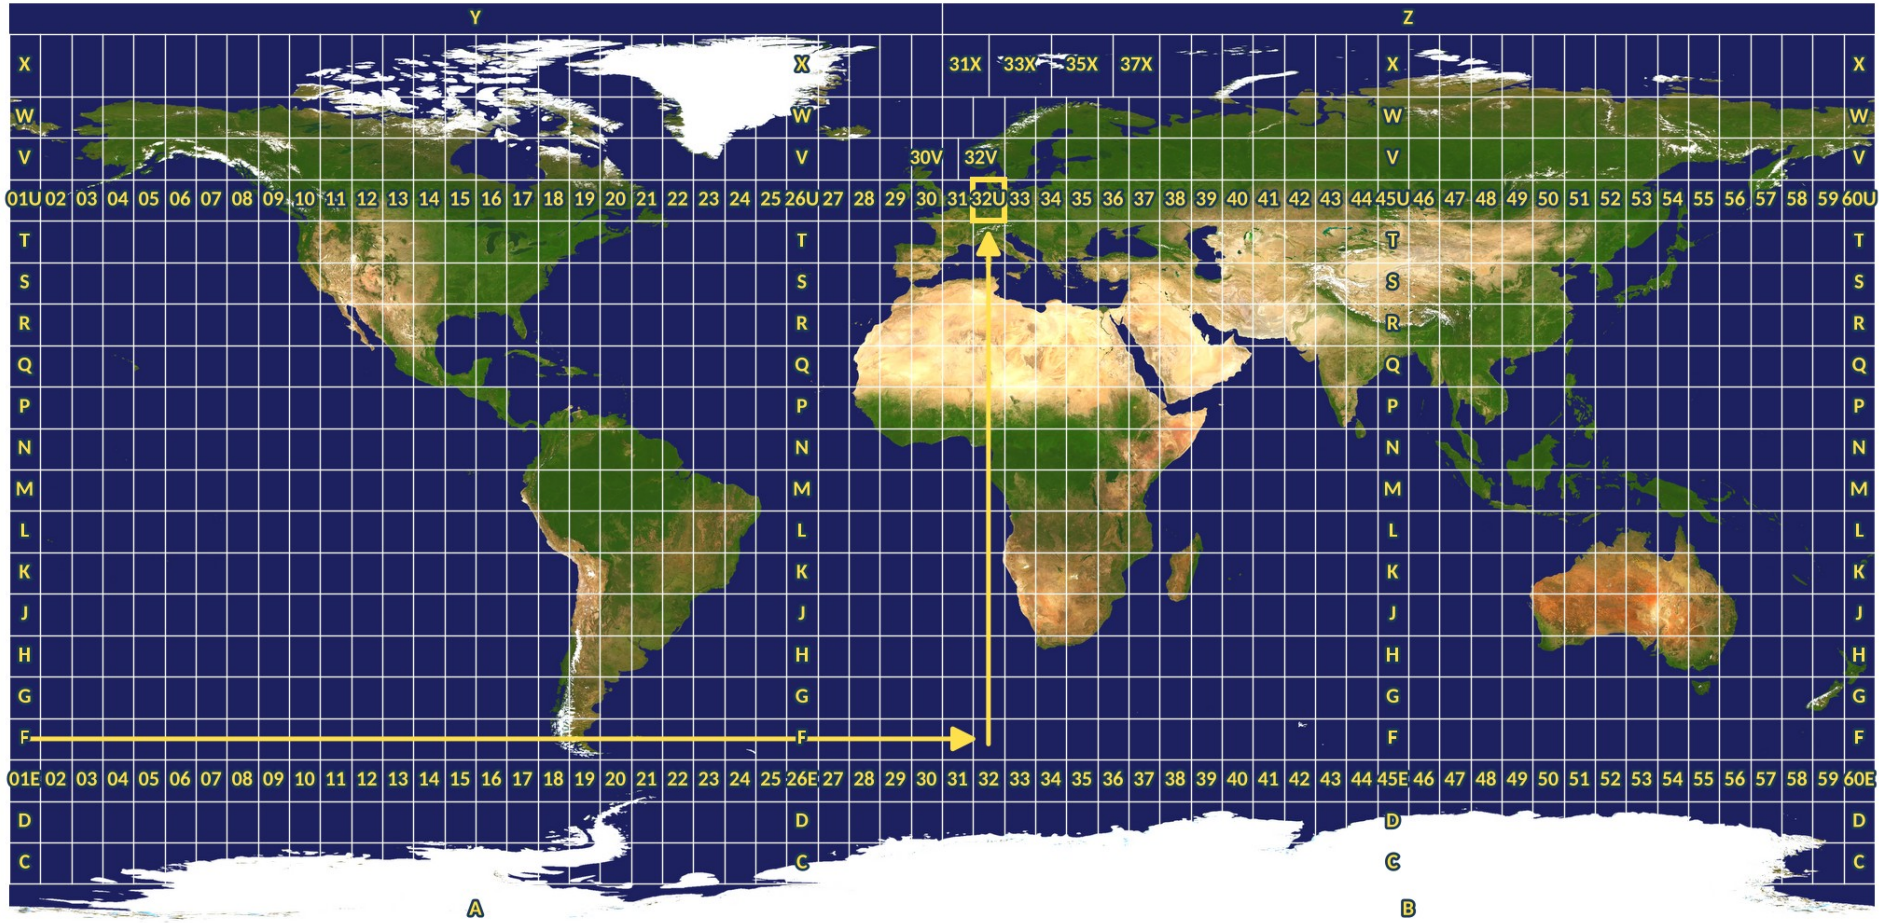

× 0.9996: tangent → secant cylinder, true scale ≈ 181 km east and west

Count the digits, read the first ones. In degrees, check which value is the latitude.

Wikipedia: EPSG Geodetic Parameter Dataset

DHDN → ETRS89 is a transformation

- New datum: new ellipsoid and new position
- Same numbers ≈ 154 m apart
- The method decides the accuracy

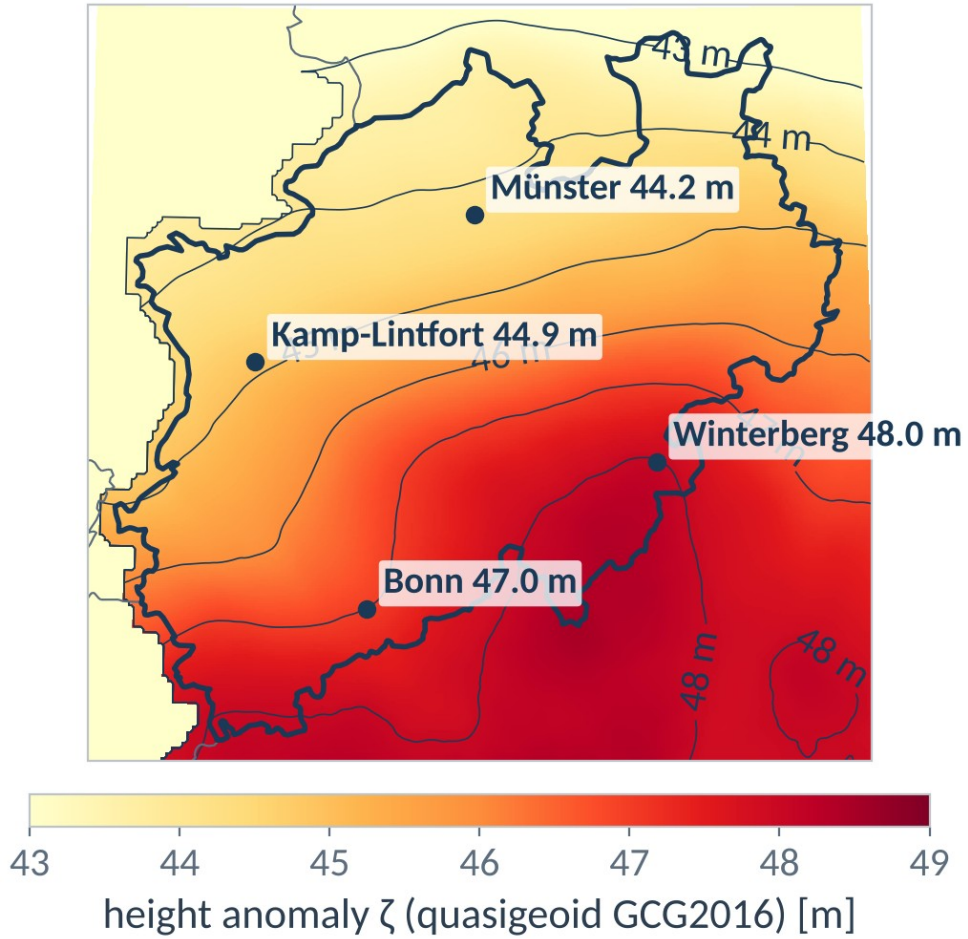

In QGIS

Reproject (Export → Save Features As…): QGIS asks which transformation to use

Pick BeTA2007 (NTv2 grid); download it if QGIS marks it as missing

Wikipedia: Helmert transformation · Geodetic datum

Heights in Germany: DHHN2016

- **h** GNSS, ellipsoidal (ETRS89)
- **H** maps, DEM NRW: DHHN2016 (NHN)
- **H = h − ζ**, ζ from GCG2016 (< 1 cm)
- NRW: ζ ≈ 44 … 48 m

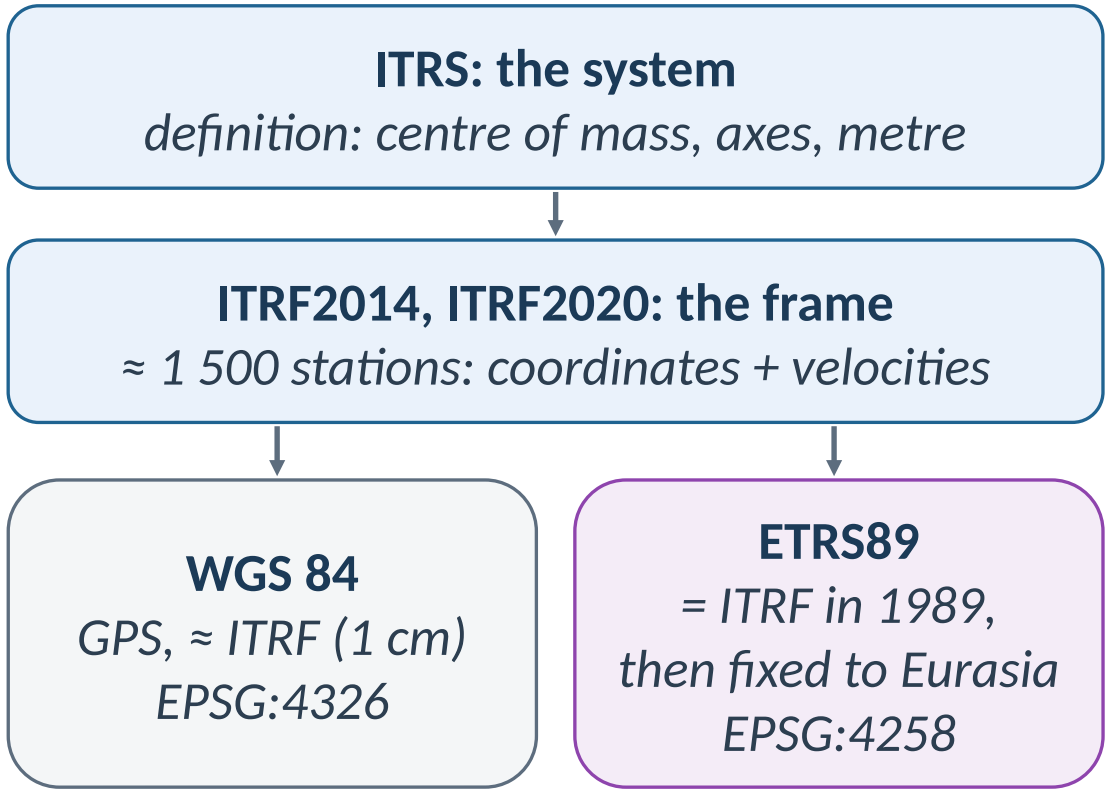

In QGIS

DEM metadata: DHHN2016 or EGM2008?

Project → Properties → CRS: vertical CRS EPSG:7837

Wikipedia: Normal height · Geoid

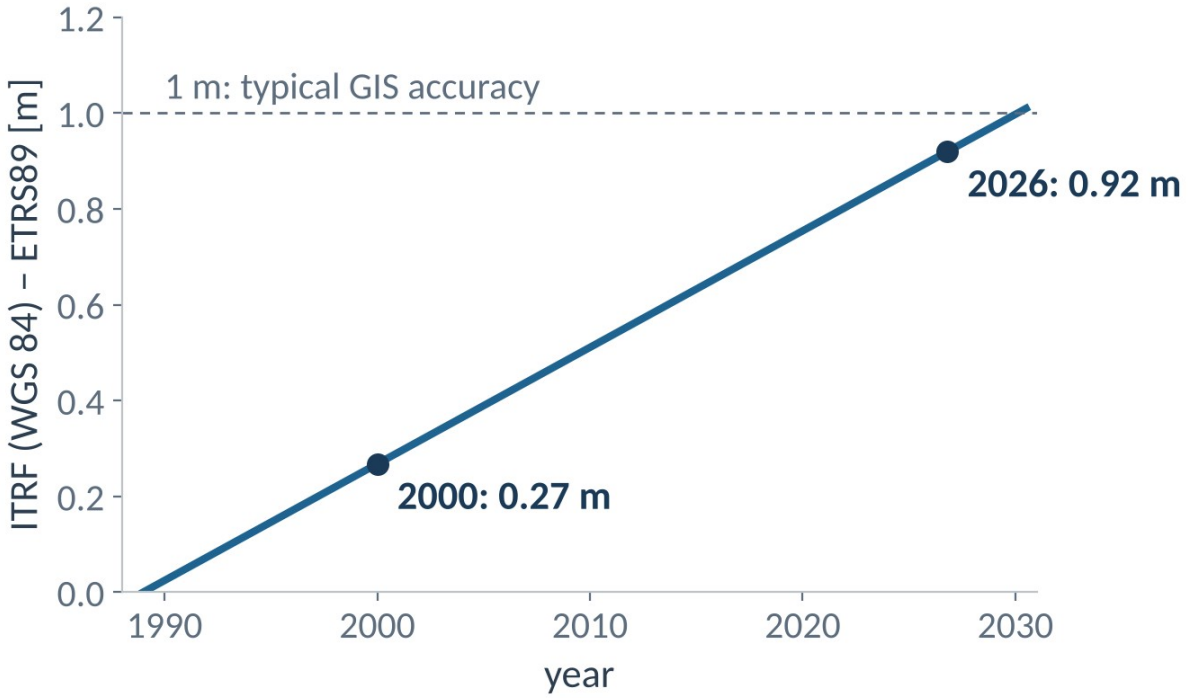

ITRF: the global reference frame

- The plates move: in ITRF, Germany moves ≈ 2.5 cm per year north-east
- ITRF / WGS 84: grid fixed to the whole Earth, coordinates change
- ETRS89: grid glued onto Europe, coordinates stay
- Kamp-Lintfort 2026: 0.92 m apart

Wikipedia: International Terrestrial Reference System and Frame

ETRS89 is not WGS 84

- ETRS89 is fixed to the Eurasian plate (1989)
- WGS 84 is global: Europe moves ≈ 2.4 cm per year north-east
- Kamp-Lintfort 2026: 0.92 m apart
- GIS at 1 m: treat as equal
  GNSS / RTK: use ETRS89 (SAPOS)

Wikipedia: ETRS89 · Plate tectonics
